31. A method of improving bioavailability of ergot derivatives administered using sustained-release delivery systems comprising combining an ergot derivative or mixture thereof with a pharmaceutically acceptable hydrophilic swelling agent or mixture thereof and one or more pharmaceutically acceptable excipients, and wherein the bioavailability is at least 25% higher than the bioavailability of the ergot derivative or mixture thereof administered using a conventional drug delivery system;

said ergot derivative is selected from the group consisting of α -dihydroergocryptine and bromocriptine.

32. A sustained-release pharmaceutical composition comprising:
an ergot derivative or mixture thereof;
a pharmaceutically acceptable swelling agent or mixture thereof; and
one or more pharmaceutically acceptable excipients;

said composition having a bioavailability at least equal to the bioavailability of the ergot derivative or mixture thereof administered using a conventional drug delivery system, and wherein said ergot derivative is selected from the group consisting of α -dihydroergocryptine and bromocriptine.

- 33. The composition according to Claim 32, wherein the bioavailability is at least 25% higher than the bioavailability of the ergot derivative or mixture thereof administered using a conventional drug delivery system.
- 34. The composition according to Claim 32, wherein the ergot derivative is α -dihydroergocryptine.
- 35. The composition according to Claim 32, wherein the hydrophilic swelling agent is selected from the group consisting of methylcellulose, carboxymethylcellulose, hydroxypropylmethylcellulose, polyvinyl alcohols, polyoxyethylene glycols and poloxamers and mixtures thereof.
